Bond Company: \_\_\_\_\_  
 Bond #: \_\_\_\_\_ Exp. Date: \_\_\_\_\_

Signature of Applicant: \_\_\_\_\_ Date: \_\_\_\_\_

### Note:

Plumbing and sprinkler contractors need only submit the completed application for contractor registration and a copy of the business state registration.

## **Help Protect our Ponds, Rivers and Streams**

Stormwater is water caused by precipitation (rain or snow melt) that doesn't soak into the ground but runs off into waterways. Stormwater can pick up and transport a variety of pollutants.

Sediment is the most common type of pollutant in our rivers and streams.

### What is sediment?

Sediment is the loose sand, clay, silt and other soil particles that settle at the bottom of a body of water.

The most concentrated sediment releases are the result of construction activities. Sediment can clog fish gills, reducing resistance to disease, lowering growth rates, and affecting fish egg and larvae development.

Many construction sites use a silt fence or mulch logs to control and prevent soil erosion and sediment from entering our storm sewer systems. You can help by understanding the important role that these perimeter controls provide. When you enter a construction site, avoid damaging these important control measures. If damage occurs, please notify the project manager so that repairs can be made immediately.

Thank you,

Village of New Lenox
